ABSTRACTED-PUB-NO: WO2003042494A

BASIC-ABSTRACT:

NOVELTY - A stabilizing apparatus comprises a delivery pipe (16) having an opening (22) for delivering a treatment fluid to a zone of borehole, and a flexible expandable sleeve (30) secured on the outside of the pipe around an opening such that fluid flowing from the pipe through the opening flows into the sleeve. The sleeve is formed from a permeable material

USE - The apparatus is used for stabilizing a borehole (e.g., oil, gas, water and geothermal wells) by flowing treatment fluid through pipe opening into the sleeve. It can also be used to install a gravel pack, or provide external casing packers in the borehole (all claimed).

ADVANTAGE - The apparatus allows drilling of borehole without loss of circulation. It avoids damage to the sleeve when the apparatus is lowered into the well. It also allows control of the axial extent of the application of the treatment fluid and control of the permeability of the treatment.

DESCRIPTION OF DRAWING(S) - The figure shows a stabilizing apparatus in use.
